Test Method for John Deere Coolant Cavitation Test. Test Method for John Deere Coolant Cavitation Test. Sel'skohozjajstvennaja tehnika: obsluzhivanie i remont (Agricultural Machinery: Service and Repair). Identifying and analyzing John Deere tractor trouble codes based on CAN bus.
The article discusses modern technologies for diagnosing the technical condition of agricultural automotive equipment on the example of a John Deere tractor. A

description of the John Deere tractor and electronic systems is given. Modern tractors are equipped with microprocessor-based control systems with diagnostic capabilities. This makes it possible to timely inform the operator about possible malfunctions of the working systems of the tractor, for example, the engine or brake system. The system of digital communication and control of the electric devices of the vehicle — the CAN interface — allows you to collect data from all devices, exchange information between them, manage them.

Pametna poljoprivreda na primjeru silažnog kombajna John Deere 8500i, Smart farming on the example of the John Deere 8500i forage harvester.
Samohodni silažni kombajni sve više se upotrebljavaju kod sjeckanja razli?itih usjeva za silažu. Op?i trend je izrada silažnih kombajna ja?e snage motora uz pove?anje u?inkovitosti. Na primjeru John Deere 8500i prikazana su neka rješenja za preciznu poljoprivredu. Ugra?eni NIR analizator omogu?uje odre?ivanje suhe tvari i druge analize u krmi. Na osnovi suhe tvari u krmi automatski se nastavlja duljina sje?ke. Izravno u kombajnu ili na daljinu mogu se pratiti radni parametri kombajna i sjeckane krme. Na ra?unalu se dobije potpuna analiza rada.

TRAILBLAZER FACTORY SERVICE MANUAL

Journal of Plant Registrations. J of Plant Registrations. Registration of NE Trailblazer C?1, NE Trailblazer C0, NE Trailblazer C2, NE Trailblazer C3, NE Trailblazer C4, and NE Trailblazer C5 Switchgrass Germplasms.

NE Trailblazer C?1 (GP?101, PI 672015), NE Trailblazer C0 (GP?100, PI 672014), NE Trailblazer C2 (GP?102, PI 672016), NE Trailblazer C3 (GP?103, PI 672017), NE Trailblazer C4 (GP?104, PI 672018), and NE Trailblazer C5 (GP?105, PI 672019) switchgrass (Panicum virgatum L.) germplasms were released by the USDA?ARS and the University of Nebraska?Lincoln on 10 Sept. 2014. These germplasms were developed by six generations of divergent breeding for in vitro dry matter digestibility (IVDMD). As a result of the multigenerations of recurrent breeding, the resulting populations differ significantly for IVDMD and for 25 other forage quality or biomass composition traits, including both acid detergent and Klason lignin. Plants in the high IVDMD populations also had altered anatomical structure. The lignin concentration of the stems was altered more than that of the leaves. The germplasm populations also differ significantly for winter survival.

Altering plant composition by selection for IVDMD adversely affected the winter survival fitness of the resulting populations by unknown mechanisms. Plants from these germplasms can be used in genetics studies for determining the inheritance of multiple biomass composition traits and for identifying genes controlling specific biomass composition properties and winter survival of switchgrass and other perennial grasses.

Mexico: Informing service providers and factory workers about emergency contraception. L51717 Pipeline In-Service Relocation Engineering Manual.
~~The practice of "relocation" of a pipeline while "in-service" increases the longitudinal stresses in the relocated section of pipeline which may result in pipeline failures. On October 22, 1991, the DOT Office of Pipeline Safety (OPS) issued an "Alert Notice" to US Pipeline operators urging them to conduct analyses prior to moving a pipeline, regardless of whether the line is in-service during the operation or not; to determine the extent to which a pipeline may be safely moved, considering the material toughness as a factor; and specific procedures for the operation. An incident associated with pipeline movement for which no engineering assessment was performed will probably receive the scrutiny of regulators. Moreover, the relocation is apt to be blamed for any subsequent incident, with or without cause. Although the probability of incidents appears to remain low, the liability has perhaps

increased if an incident results in personal injury, property damage, or environmental damage. Operators should consider these risk factors, and whether or not to move the line in-service. The Pipeline In-Service Relocation Engineering Manual was created to provide a comprehensive manual for engineering a safe relocation on an operating pipeline in-service. All industry guidelines, standards, proceedings, and research reports were compiled, compared and distilled into recommendations for designing a safe line relocation while "in-service". This manual supplements existing guidelines such as API RP-1117 rather than superseding them. This report provides comprehensive and detailed information for pipeline operators to safely relocate a pipeline section while in-service through proper assessment of stresses and guidelines for the appropriate selection of relocation techniques and methods. This will avoid unexpected operational costs, provide guidance for "operator qualification" for pipeline relocation of in-service pipelines and minimize liabilities to the operator. The manual has been used by Pipeline Research Council International, Inc. (PRCI) member companies to generate company standards and procedures related to in-service relocation of pipelines.

ASTM B557

What is ASTM B557? ASTM B557 is a testing standard that covers the tension testing requirements of wrought and cast aluminum- and magnesium-alloy products, excepting aluminum foil (see test method E345 for aluminum foil test requirements). This method determines the strength and ductility of materials under uniaxial tensile stresses.

What is ASTM A370? ASTM A370 is an umbrella spec used to cover assorted mechanical testing on steel specimens. Tests included under the specification are tensile tests, bend tests, compression tests, impact tests and hardness tests.

What is the standard for tensile testing aluminum? When testing aluminum and alloys, many follow prewritten ASTM and ISO standards. ASTM E8, ISO 6892-1, and EN 10000-2 are all-encompassing metal tensile testing standards. They cover most alloys and forms of metals. ASTM B557 is the standard test method for tensile testing non-ferrous metals.

What do ASTM numbers mean? ASTM's designation system for metals consists of a letter (A for ferrous materials) followed by an arbitrary sequentially assigned number. These designations often apply to specific products, for example A548 is applicable to cold-heading quality carbon steel wire for tapping or sheet metal screws.

What is ASTM E505? ASTM E505 is a vital standard that defines acceptable quality levels for aluminum and magnesium die castings. This standard utilizes specially produced radiographs, which are created under controlled conditions tailored to expose a range of discontinuities. These radiographs serve a dual purpose.

What is the difference between ASTM E8 and ASTM A370? A370 differs from E8 in that it further defines the specimen characteristics of steels specific to several different product types. These products discuss the testing of bar, tube, fasteners, and round wire, and are included in the annexes to ASTM A370 along with some procedural clarification.

What material is ASTM A370 equivalent to? ASTM A370, which is identical with ASME SA-370, is the standard specification covering test methods and definitions for mechanical testing of ferrous and nonferrous metals such as steels, stainless steels, titanium & its alloy, nickel and its alloy, zirconium and its alloy, etc.

What is the ASTM A370 Charpy impact test? ASTM A370 also includes Charpy impact test method requirements but focuses only on steel products. All three standards provide details for properly measuring the energy absorbed by the notched specimen when impacted by a swinging pendulum.

What is ASTM for Aluminium? ASTM B211 | Standard Specification for Aluminum and Aluminum-Alloy Rolled or Cold Finished Bar, Rod, and Wire.

What is the tensile test for aluminum 2024? 2024-T3. T3 temper 2024 sheet has an ultimate tensile strength of 400–430 MPa (58–62 ksi) and yield strength of at least 270–280 MPa (39–40 ksi). It has an elongation of 10–15%.

What is the ISO standard for tensile testing? ISO 527-1 tensile testing provides key data on tensile strength, modulus and elongation of plastics at ambient, elevated or reduced temperatures. Scope: Tensile tests measure the force required to break a plastic sample specimen and the extent to which the specimen stretches or elongates to that breaking point.

What is ASTM A and ASTM B? ASTM A standards are related to ferrous metals, while ASTM B standards are related to non-ferrous metals such as aluminum and copper.

What is ASME and ASTM? ASTM (American Society for Testing and Materials) and ASME (American Society of Mechanical Engineers) are two different organisations in the USA that deal with standards and specifications in the field of materials, construction and test methods.

What is ASTM grade? ASTM steel grades are those that meet the exacting standards for specific grades of steel developed by the American Society for Testing and Materials. The standards include mechanical properties and steel chemistries and specify the testing methods to be used.

What is ASTM E155? Inspection of Aluminum and Magnesium Castings1. This standard is issued under the fixed designation E 155; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision.

How to check porosity in aluminium casting?

What is the difference between ASTM E and D? ASTM International standards are designated with a specific prefix which denotes the broad scope of the standard. For instance: ASTM D refers to miscellaneous materials. ASTM E refers to miscellaneous subjects.

What is the standard for ASTM density? Scope: Density is the mass per unit volume of a material. Specific gravity is a measure of the ratio of mass of a given volume of material at 23°C to the same volume of deionized water.

What is ASTM D 751? Specification ASTM D751 includes test methods for covering a wide range of mechanical properties of coated fabrics. A coated fabric is a material that has at least one layer of a textile and one layer of a polymeric substance. Examples would be tarps, outdoor clothing, and rain wear.

What is ASTM in piping? ASTM piping are the pipes and fittings made to meet the standards set by the American Society for Testing and Materials (ASTM). These standards specify the properties and quality requirements for various types of pipes and fittings used in various applications are , for water and gas supply, plumbing, and construction.

What is the difference between ASTM and AATCC? In general, AATCC methods tend to focus on colorfastness, wet testing, and chemical analysis. ASTM tests evaluate physical properties of textiles. AATCC and ASTM have published several joint Testing Supplements.
