Quantifying Player-Induced Intonation Errors of the Steel String Acoustic Guitar.

Data from a previously published study on same-note pitch variability of the steel string acoustic guitar were subjected to additional analysis to isolate and quantify the sources of intonation error. Pitch error components associated with the construction

of the guitar, the player's tendency to play sharp, and the player's tendency to pitch variability were identified and isolated by simple arithmetic operations. The player-associated error components were found to be substantially related to the fret being played. Per-player sharpening tendency values for the G string ranged from 0 – 4 cents on fret #1, 0 – 6 cents on fret #5, and 0 – 10 cents on fret #12. Per player pitch variability mean values ranged from 0 – 2 cents on fret #1, 1 – 4 cents on fret #5, and 1 – 7 cents on fret #12. Quantifying player-associated pitch error tendencies may be useful in optimizing an instrument's intonation for that player.

Supported by technological advances such as extended-range guitars, virtuosos in the twenty-first century are exploring ways to expand standard playing techniques in a climate where ever-higher levels of perfection are expected. As musician-entrepreneurs, contemporary rock guitar virtuosos record, produce, and market their music themselves; operate equipment companies; and sell merchandise, tablature, and lessons online. For their social media channels, they regularly create videos and interact with their followers while having to balance building their tribe and finding the time to develop their craft to stay competitive. This chapter outlines the implications of the book and makes recommendations for future research and policy considerations. I argue that relying on identifying and separating gang members not only fails to prevent violence in carceral institutions but also has serious consequences for those who are processed through these facilities. Namely, this practice positions individuals into rivalries between criminalized affiliations—exposing them to confrontation and violence and ultimately ascribing them with criminal labels that keep them cycling through the justice system. This chapter also explores alternative models, discussing instances both in this research and in previous studies in which criminal justice facilities desegregated their institutions. Finally, I argue that establishing a more just and effective criminal justice system requires reducing the emphasis institutions place on identifying and controlling gang membership.

The Indonesian version of IPAQ is valid and reliable as a measuring tool for physical activity in Indonesian people.
