JTP - Jurnal Teknologi Pendidikan. JTP. Developing Guided Reading Guidebook through Leveled Books to Improve Reading Skills of Grade 1 Students.

Guidebooks for guided reading methods through tiered books have not been found in learning reading skills. Still, based on several previous studies, the impact of using guided reading methods and tiered book media is very effective in reading skills. Therefore, this study aims to develop a guidebook product for guided reading methods through tiered books to improve the reading skills of grade 1 elementary school students. This study used a Research and Development (R&D) approach using the 4D development model, focusing on the 3 stages of 4D development namely define, design, and develop. The research subjects comprised 1 grade 1 teacher and 32 grade-1 students at SD Negeri Sarirejo 1, Demak. The data collection technique used a questionnaire which was then analyzed and described to provide an overview of the feasibility and effectiveness of the guidebook. The product feasibility test was analyzed using percentages and the product effectiveness test was analyzed using the Wilcoxon Signed Rank Test, t-test, and N-Gain test. The results of the study explained that the guidebook for guided reading methods through leveled books was said to be feasible with a value of 92.4% from media experts, 92% from material experts, and 89.7% from practitioners. The results also provide an effectiveness value through a t-test with the value of the  $H_a$  t-test analysis accepted and the N-Gain obtained is 0.63. Thus, it can be explained simply that the guidebook for guided reading methods using tiered books is feasible and effective to be used by teachers to support Indonesian language learning, especially in reading skills.

Developing an Achievement Test about 7th Grade "Solar System and Beyond" Unit: Analysis of Validity and Reliability.

The aim of this research is to develop a reliable and valid achievement test to measure academic success of pupils about 7th grade's "Solar System and Beyond" unit. For this reason, depending on the objectives of "Solar System and Beyond" unit, which is included in middle school science program, which was published in 2018, 42 multiple-choice test questions were prepared. The clearness of the test questions, cohesion with the objectives and scientific knowledge were designed with the care of various sights of the authorities in teaching science field which depend on the technic which was suggested by Lawshe (1975). According to this, content validity score was calculated as .94. The pilot study for this test put into practice with 254 students who had studied 7th grade in 2018-2019 academic years. As a consequence of the item statistic which was realized in the process of test development by the answers of the students for each question, difficulty score and item discrimination were calculated for each of the item. As a consequence of item statistic, 8 items were excluded from the test and the last form of the "Solar System and Beyond Academic Achievement Test" was designed with 35 questions. As a result of the analysis, the last form's KR-20 reliability co-efficient was calculated as

.87. Average item difficulty index was calculated as .61 and average item discrimination index was calculated as .48. According to this outcome, average item difficulty was identified as midlevel, and average item discrimination was identified as high-level.

Early modern readers of Herodotus, especially those in the Italian peninsula, on occasion established an analogy between their situation in relation to the expanding Turkish empire in the sixteenth century and that of the eastern Mediterranean world, especially the Greek world, in relation to the Persian empire as outlined in Herodotus' Histories. Readers used their encounter with the Herodotean text as a filter through which to comment on and make sense of what at times must have appeared to them to be the beginning of the end of western culture as they knew it. In 1491, not long after the Este court in Ferrara sponsored Matteo Maria Boiardo's translation of Herodotus into Italian, Zoanne Pencaro, a minor figure in the court, commissioned the production of a manuscript copy in which he made a remarkable set of annotations in the vernacular (nearly 2500 words) that show a growing awareness of the ancient near east.

Displacement mapping is routinely used to add geometric details in a fast and easy-to-control way, both in offline rendering as well as recently in interactive applications such as games. However, it went largely unnoticed (with the exception of McGuire and Whitson [MW08]) that, when applying displacement mapping to a surface with a low-distortion parametrization, this parametrization is distorted as the geometry was changed by the displacement mapping. Typical resulting artifacts are “rubber band”-like distortion patterns in areas of strong displacement change where a small isotropic area in texture space is mapped to a large anisotropic area in world space. We describe a fast, fully GPU-based two-step procedure to resolve this problem. First, a correction deformation is computed from the displacement map. Second, two variants to apply this correction when computing displacement mapping are proposed. The first variant is backward-compatible and can resolve the artifact

in any rendering pipeline without modifying it and without requiring additional computation at render time, but only works for bijective parametrizations. The second variant works for more general parametrizations, but requires to modify the rendering code and incurs a very small computational overhead.
