**What is the first aid answer?** First aid refers to medical attention that is usually administered immediately after the injury occurs and at the location where it occurred. It often consists of a one-time, short-term treatment and requires little technology or training to administer.

**What is a first aid procedure that supplies oxygen and blood to the body until normal function resumes?** 4. What is CPR? Life saving first aid procedure that combines rescue breaths with chest compressions supplying oxygen to the body until normal body functions can resume.

**What is a life-threatening condition in which the heart is not delivering an adequate supply of blood to the body?** shock – a life-threatening condition in which the heart is not delivering an adequate supply of blood to the body.

**Which of the following is the first step in responding to an emergency?** Recognizing an emergency is the first step in responding. You may become aware of an emergency from certain indicators.

**What is the short answer to first aid box?** (f??st?e?d k?t ) noun. a box containing equipment needed to give immediate medical help in an emergency.

**What is the first aid symbol answer?** The internationally accepted symbol for first aid is the white cross on a green background shown below.

**How many compressions per minute?** Push hard and fast in the center of the chest. You want to do 100 to 120 compressions a minute. The American Heart Association suggests doing compressions to the beat of the song "Stayin' Alive" or another song that has 100 to 120 beats a minute. Allow the chest to spring back after each push.

**What does the C stand for in cab?** The three basic parts of CPR are easily remembered as "CAB": C for compressions, A for airway, and B for breathing. C is for compressions. Chest compressions can help the flow of blood to the heart, brain, and other organs.

**How many seconds should you check for breathing?** Note: Check for no more than 10 seconds. If the person does not respond, is not breathing, is only gasping, or has life-threatening bleeding or another life-threatening condition, immediately call 9-1-1, get equipment and give care based on the condition found according to your level of training.

**What is the order of the blood vessels that a red blood cell?** Red blood cells pick up oxygen in the lungs. Blood travels away from the heart and lungs through the arteries (ar-tuh-reez). Red blood cells drop off oxygen to the cells through tiny tubes called capillaries (cap-ill-air-ies). Blood then returns to the heart through the veins (vayns) and the cycle begins again.

**What function does the circulatory system share with the heart?** The circulatory system is made up of blood vessels that carry blood away from and towards the heart. Arteries carry blood away from the heart and veins carry blood back to the heart. The circulatory system carries oxygen, nutrients, and hormones to cells, and removes waste products, like carbon dioxide.

**What is a sudden interruption of blood supply to the heart?** Myocardial ischemia, also called cardiac ischemia, reduces the heart muscle's ability to pump blood. A sudden, severe blockage of one of the heart's artery can lead to a heart attack. Myocardial ischemia might also cause serious abnormal heart rhythms.

**What are the 3 C's of CPR?** There are three basic C's to remember—check, call, and care. When it comes to first aid, there are three P's to remember—preserve life, prevent deterioration, and promote recovery.

**What position should a person who responds but is not fully awake be placed in?** If the person is responsive but not fully awake, put the person in the recovery position.

**What are the 3 P's of first aid?** Preserve, Prevent and Promote The three p's of first aid form the foundation of effective emergency response. By understanding the importance of preserving life, preventing deterioration, and promoting recovery, you can make a significant impact on the outcome of an emergency.
